## /02/-A

## **BEAM POWER TUBE**

Typical Operation:										
Values are for 2 tubes										
Plate Supply Voltage	410	volts								
Grid-No.2 Supply Voltage	*	volts								
Cathode Resistor	220	ohms								
Peak AF Grid-No.1-to-Grid-No.1 Voltage	<b>6</b> 8	volts								
Zero-Signal Cathode Current	134	ma								
MaxSignal Cathode Current	<b>15</b> 5	ma								
Effective Load Resistance		ł								
(Plate to plate)	8000	ohms								
Total Harmonic Distortion	1.6	%								
MaxSignal Power Output	24	watts								
Martiner Atautt Walnus										

### Maximum Circuit Values:

Grid-No.1-Circuit Resistance:

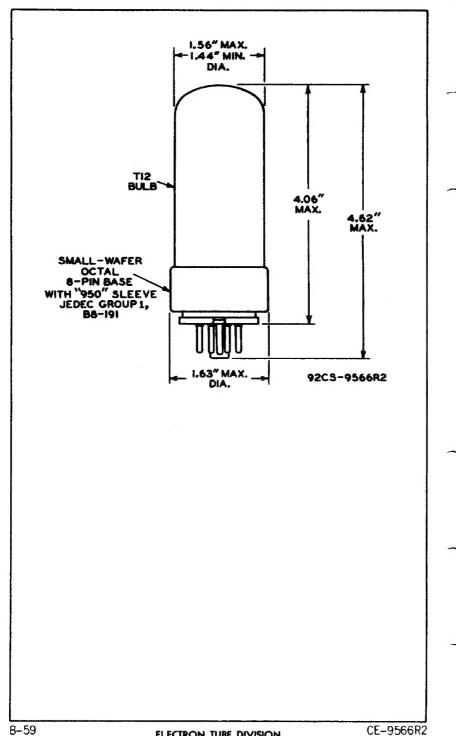

For cathode-bias operation. . . . . . 0.5 max. megohm

- $^{\rm O}$  Without external shield.
- $^{lacktriangle}$  The dc component must not exceed 100 volts.
- The type of input coupling network used should not introduce too much resistance in the grid-No.1 circuit. Transformer- or impedance-coupling devices are recommended.
- \* Obtained from taps on the primary winding of the output transformer. The taps are located on each side of the center-tap (B+) so as to apply 43 per cent of the plate signal voltage to grid-No.2 of each output tube.

### OPERATING CONSIDERATIONS

The bulb becomes hot during operation. To insure adequate cooling, therefore, it is essential that free circulation of air be provided around the 7027-A.
